

# CO<sub>2</sub> (R744) for Data Centers: The Practical Journey to Sustainability

- Michael A. May, President & Chief Technology Officer, Effecterra Inc.
- Jacob Wolfe, USA Data Centers Representative, M&M Carnot

The title text is centered over a background image of a mountain lake. The image is split vertically by a diagonal line. The left side is in grayscale, showing a calm lake reflecting the surrounding forested mountains. The right side is in color, showing a similar scene but with a warm, golden light, possibly from a sunset or sunrise, illuminating the trees and the sky. The text is in a white, serif font.

# US Policy Environment & Technology Alignment

# A “Tipping Point” has been reached

**Government Policy**

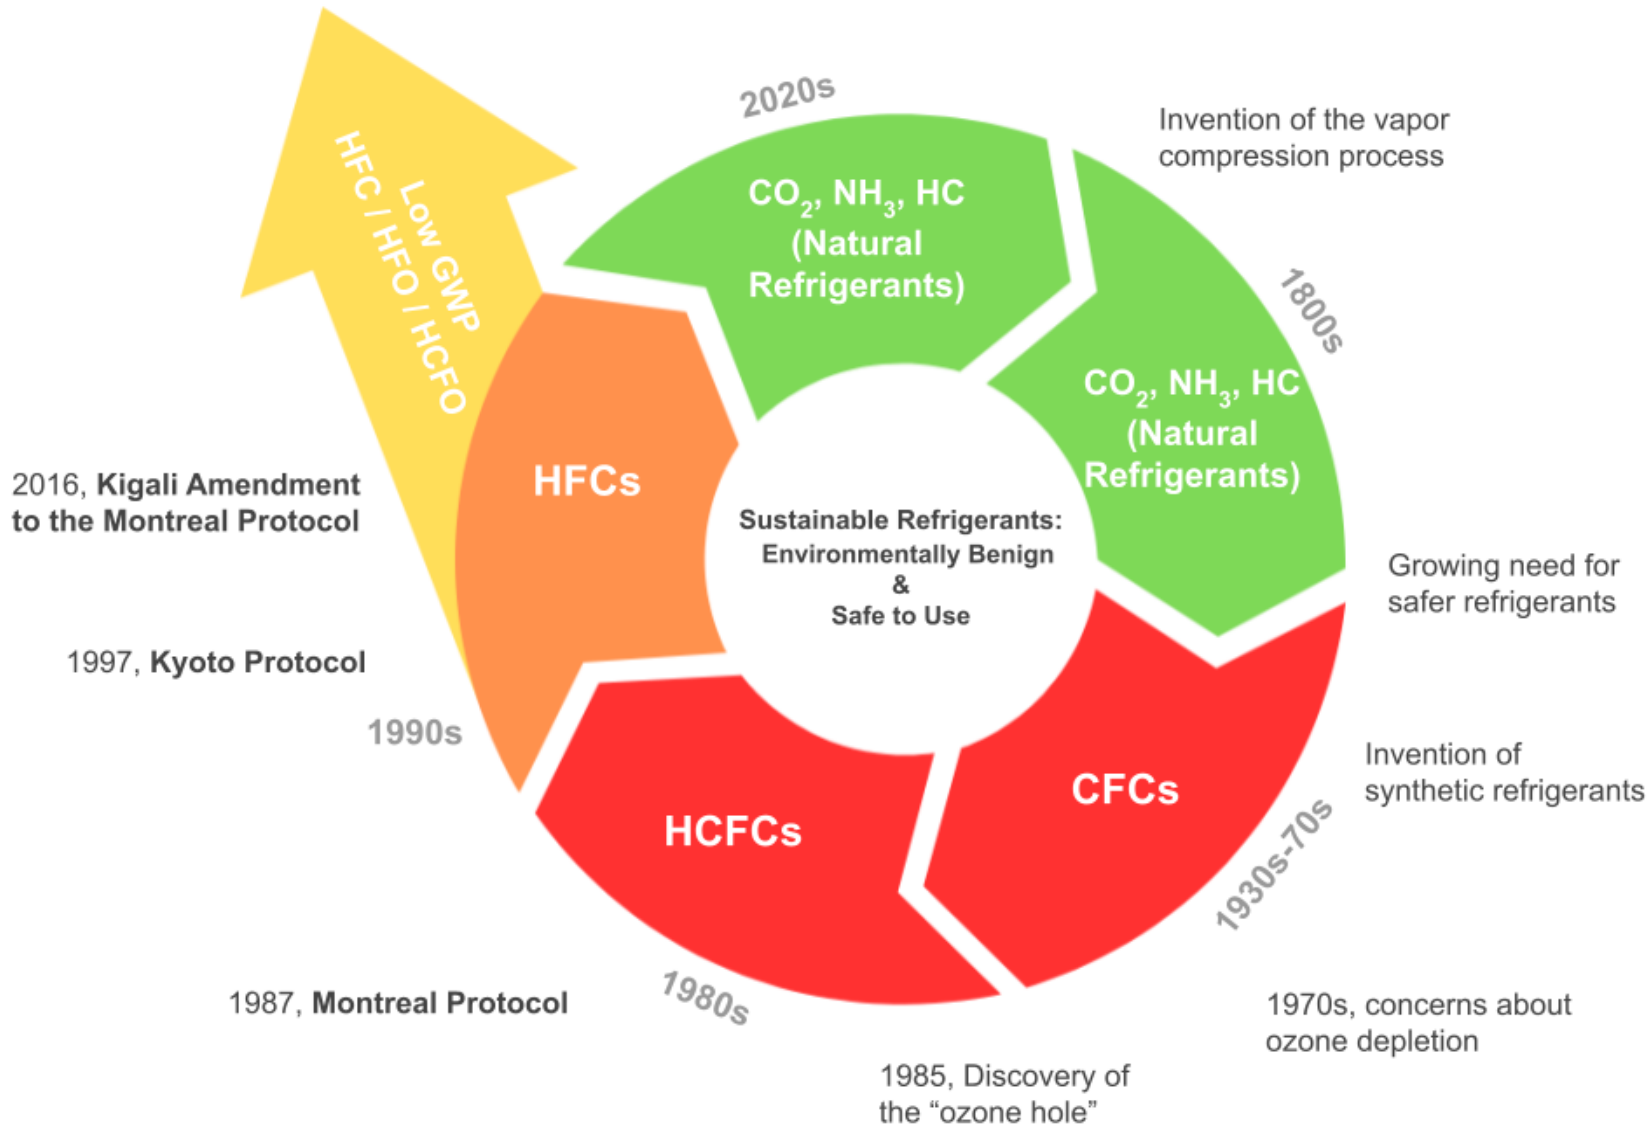

**Corporate Climate Actions**

**Societal Awareness**

**Technology Development &  
Commercialization**

Over the last two decades, these forces have built demand and enabled solutions to mitigate direct GHG emissions.

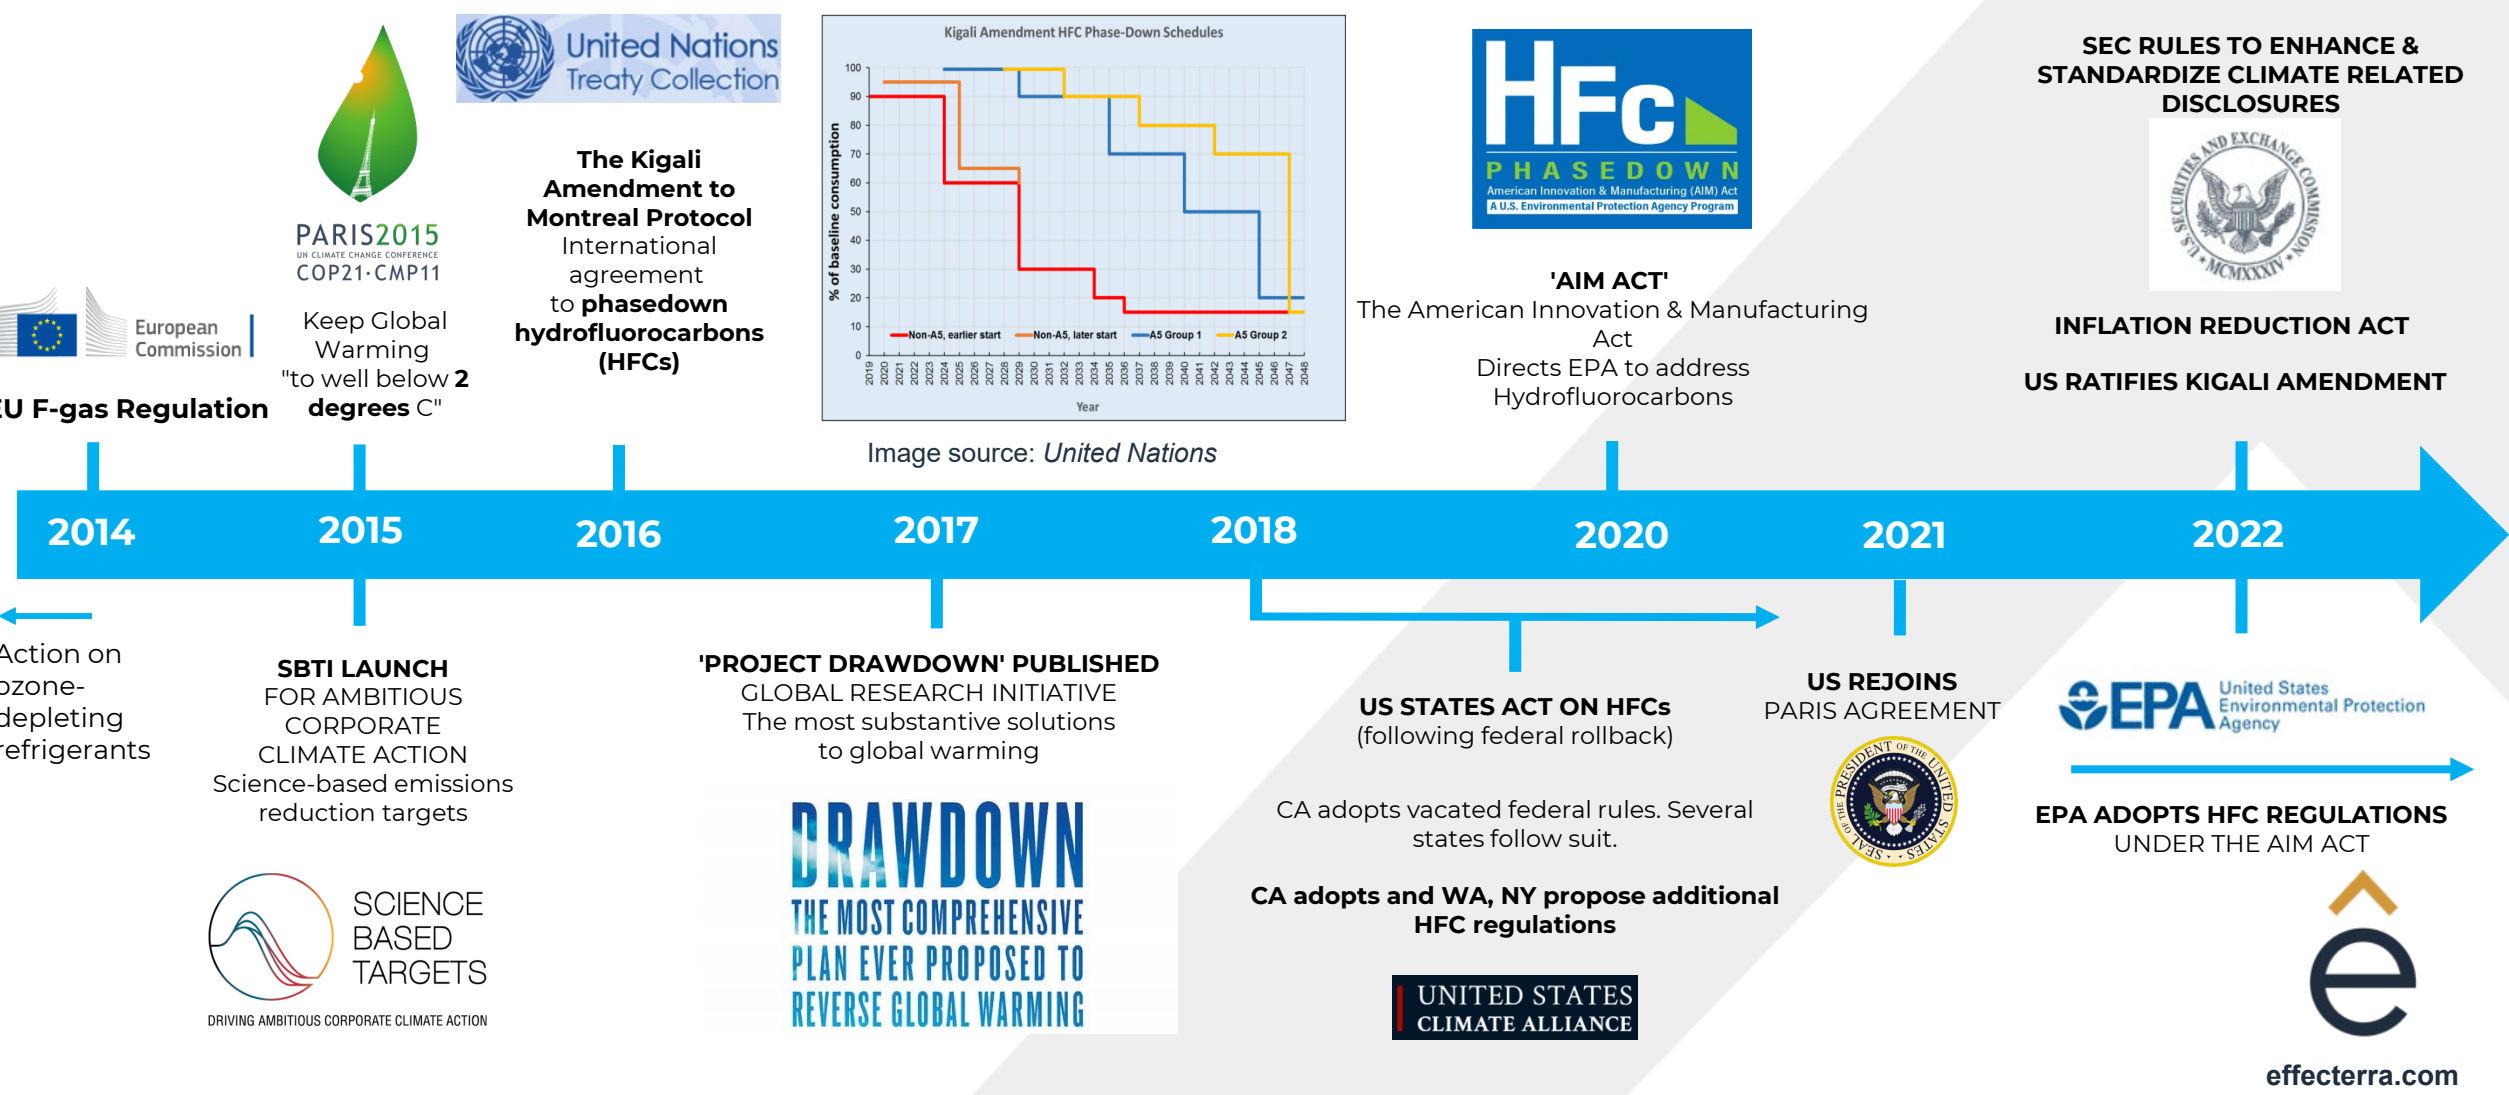

# A Brief History of Refrigerants

Refrigerant Leakage from HVAC/R assets is one of the main sources of **direct GHG emissions**.

*What* you leak is as important as *how much* you leak.

# Refrigerants Regulatory Timeline

# American Innovation & Manufacturing (AIM) Act

## HFC Phasedown

- **Reduces HFC supply.**
- A cap-and-trade program for HFCs, based on their GWP.
- Will reduce availability of high-GWP refrigerants.
- **First big, drastic cut occurs in 2024 (in 5 months)**

## Technology Transitions

- **Reduces HFC demand.**
- Puts GWP limits on new equipment.
- **Most GWP limits will go into effect on 1/1/2025.**

## Refrigerant Management

- **Reduces HFC demand.**
- The goal is to minimize leaks and maximize reclamation.
- Existing HVAC equipment will likely be affected.
- **EPA expected to propose a new regulation in 2023.**

US Policy has implemented a Carrot (Incentives) and **Stick (Regulations)** approach.

# US Technology Investments

CHIPS and Science Act - Brain

+

Infrastructure Investment & Jobs Act (IIJA) - Backbone

+

Inflation Reduction Act (IRA) - Engine

Over the past 2 years, we have seen historic investment in federal climate spending. Over the next decade, spending on climate will more than triple historic levels

**Notes:**

Average annual spending, adjusted for inflation. Note that time periods shift from 2000-2008 to 2009-2017. This is to 1) consolidate the impact of the American Recovery and Reinvestment Act to one bar and 2) address missing data between 2018-2019.

Values are based on RMI estimates using agency spending data from the Government Accountability Office (GAO), tax expenditure data from the Joint Committee on Taxation (JCT), and internal analysis on 2021-2022 legislation (Infrastructure Investment and Jobs Act, CHIPS and Science Act, Inflation Reduction Act). Spending from the American Recovery and Reinvestment Act is based on a White House memo on clean energy spending from 2010.

The averages for the Infrastructure Investment and Jobs Act, CHIPS and Science Act, and Inflation Reduction Act include both appropriations and authorizations. Note that CHIPS funding estimates are based on authorizations.

We do not include agriculture, land, or resilience appropriations from the Inflation Reduction Act in this figure because they do not directly target clean energy technology supply chains.

US Policy has implemented a **Carrot (Incentives)** and Stick (Regulations) approach.

## GHG Reductions Targets Are Now Expected

More than **70 countries**, including the biggest polluters – China, the United States, and the European Union – have set a net-zero target, covering about **76% of global emissions**.

**3,821 companies** have committed to take action with **1,817** setting a Science-based Target, and **1,399** committing to net-zero.

There are currently **8296 companies**, **52 sub-national regions**, **1136 cities**, **1125 educational**, **593 financial**, **64 healthcare institutions**, and **29 other organizations** in the Race to Zero - committed to **halving emissions by 2030** and achieving **net zero carbon emissions by 2050 at the latest**.

At least **one fifth of the world's 2,000 largest public companies** have committed to meet **net zero targets**. The companies together represent sales of nearly **\$14 trillion**.

*Data from Race to Zero and SBTi are from October 2022*

# Refrigerant Summary

Refrigerant Category	Refrigerant(s)	Application	Ozone Depleting (Y/N)	Global Warming Potential (CO <sub>2</sub> = 1)
HCFC	R-22	All	Y	~1,800
Very High GWP HFC blends	R-404A, R-507A	Refrigeration	N	~4,000
High GWP HFCs & blends	R-410A, R-407A, R-134a, R-448A/R-449A	HVAC & Refrigeration	N	~1,400 - 2,200
Mid GWP HFCs & blends	R-32, R-513A, R-454B	HVAC & Refrigeration	N	~400 – 700
HFOs	R-1234yf, R-1233zd, R-1234ze	Motor vehicle AC, Chillers	N	<10
Natural	R-290, R-717, R-744	All	N	<10

- In the **EU**, most HFOs may be banned as toxic, environmentally harmful chemicals (*designated as [PFAS under the REACH Regulation](#)*).
- In the **US**, regulatory action on HFOs as PFAS has not been announced but can happen. Several **US states** are taking the PFAS issue seriously.

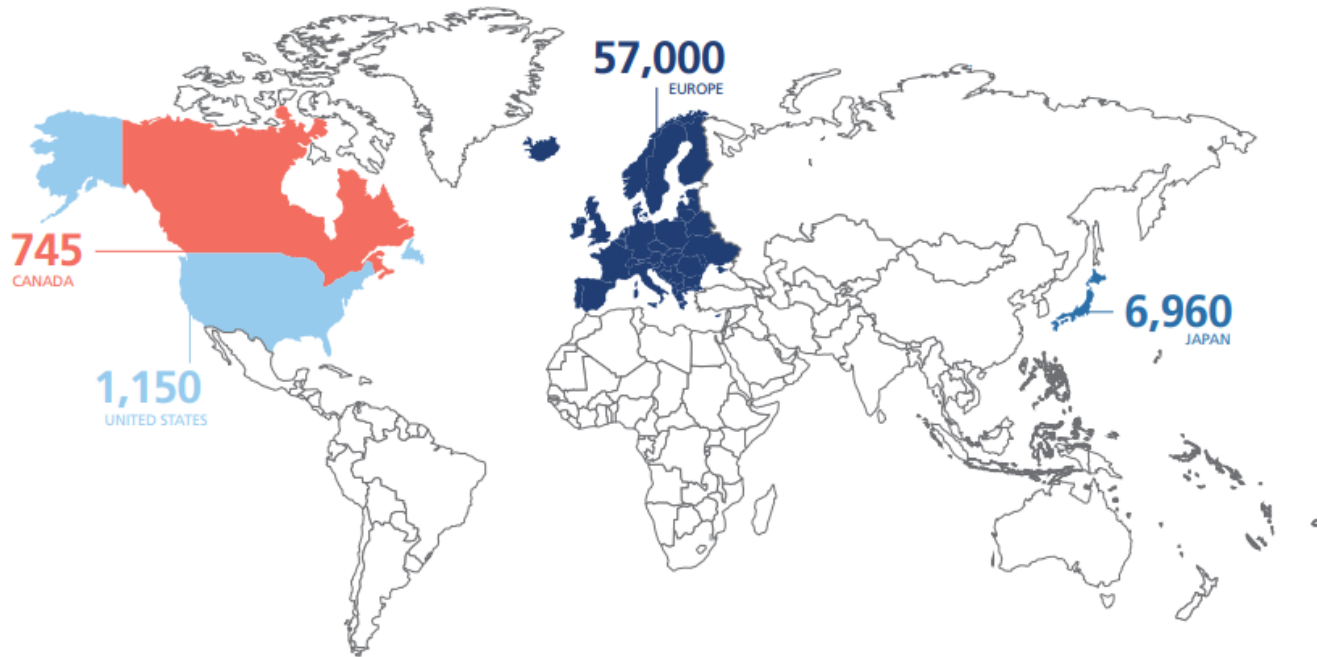

**Out of the available options, natural refrigerants are the most environmentally sustainable, future-proof refrigerants.**

# CO<sub>2</sub> Technology Global Footprint

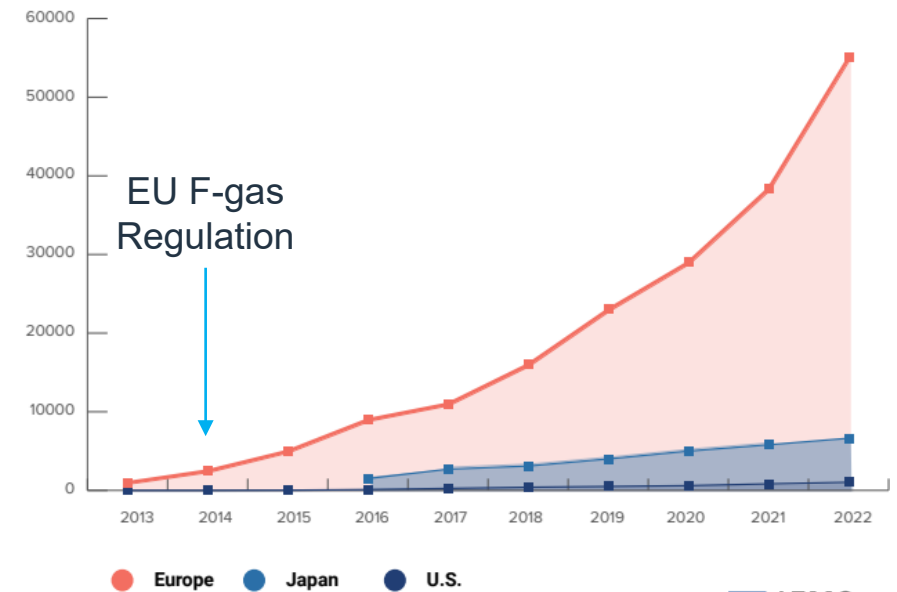

## Transcritical CO<sub>2</sub> Installations in Major Regions

(stores and industrial sites, as of December 2022)

## Transcritical CO<sub>2</sub> Installation Growth in Major Regions

(stores)

*Exponential growth in CO<sub>2</sub> systems installed in the EU after the 2014 EU F-gas Regulation. AIM Act Regulations will likely do the same in the US.*

CO<sub>2</sub> Technology related to HVAC/R applications is proven.

M&M CARNOT

# CO<sub>2</sub> (R744) for Data Centers: The Practical Journey to Sustainability

Carnot Aquilon and Cumulus Data Center Cooling

By Jacob Wolfe, LEED AP

North American DC Representative

# History

# Carbon Dioxide : History of a Refrigerant

**1850**

Alexander Twining proposed CO<sub>2</sub> as a refrigerant in his British patent

**1866**

First refrigeration system running on R-744

**1928**

CFC arrival on the market

**1989**

Montreal Protocol

**1866**

TSC Lowe (American) introduced CO<sub>2</sub> compressor

**1920-30**

Systems in subcritical operation

**1950**

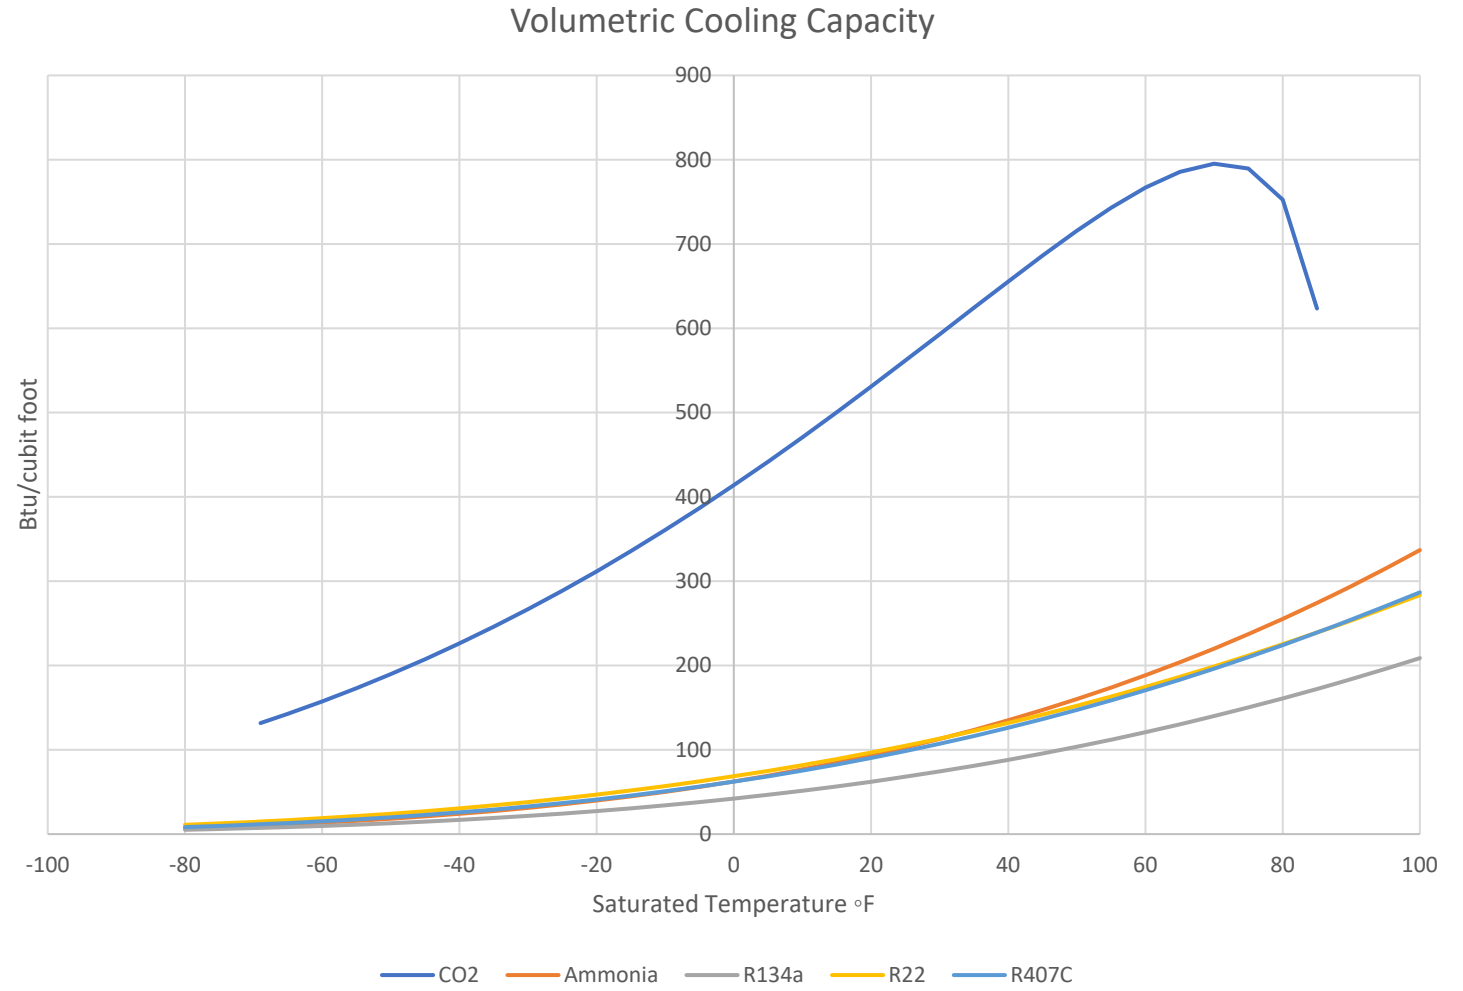

R-744 completely phased out

**1990**

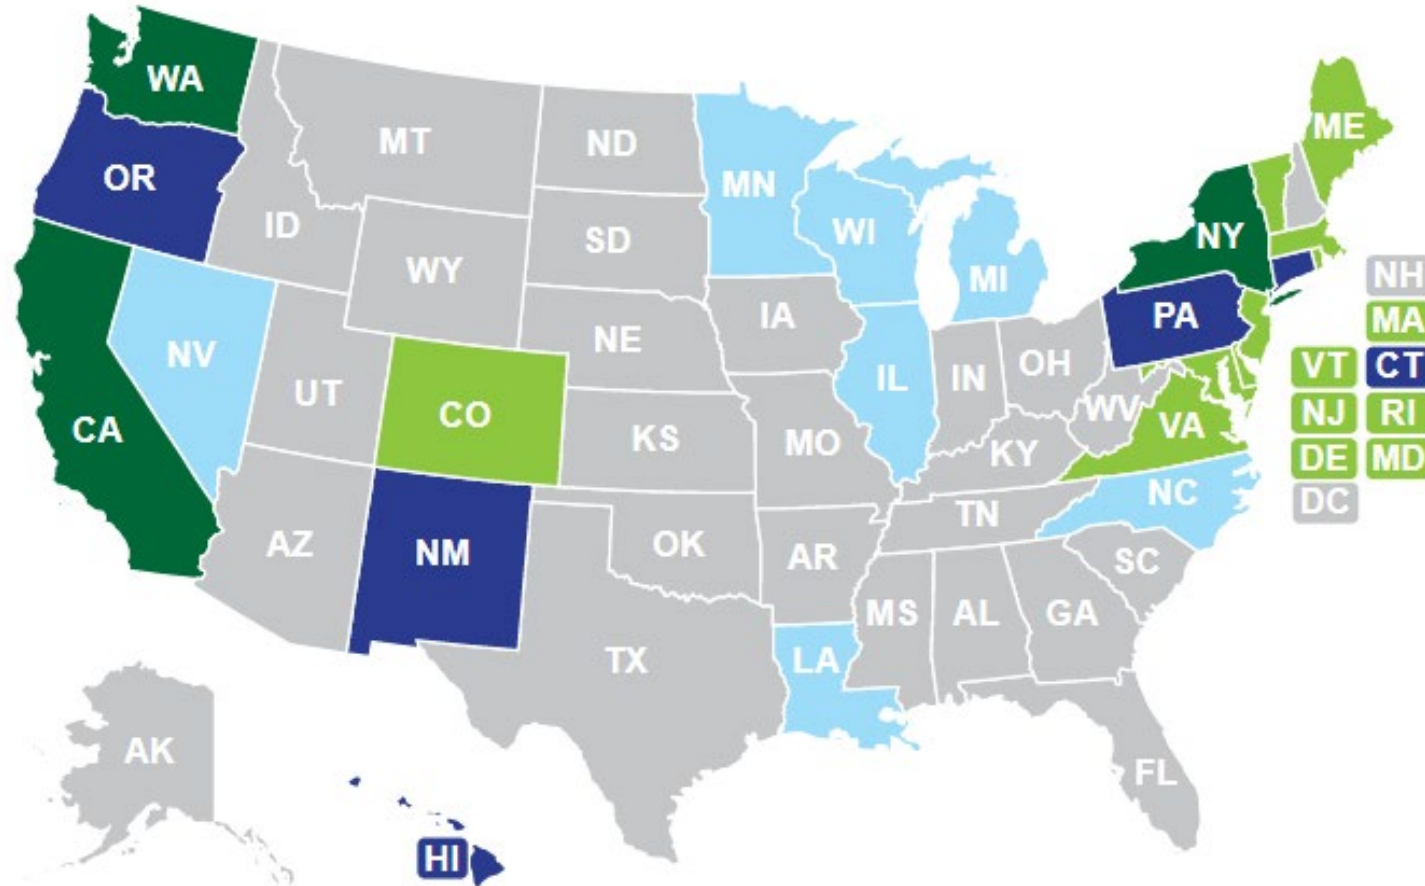

Renewed Interest in The early 90's

# CO<sub>2</sub> Volumetric Cooling Capacity

- CO<sub>2</sub> Volumetric cooling capacity is 4 to 5 times greater than other refrigerants
- Smaller compressors
- Smaller components
- Less refrigerant charge
- Smaller equipment footprint

# STATES WITH HFC LEGISLATION/REGULATIONS

- › California: 750 GWP limit (manufacturing date)
  - January 2023 for PTAC and Window AC
  - January 2024 for Chillers-Comfort Cooling
  - January 2025 for Direct HVAC other than VRF
  - January 2026 for VRF
- › Washington State like California
- › 12 states (light and dark green) have banned R410A and R134a in new chillers on Jan. 1, 2024
- › R410A and R134a Chillers for Industrial Process Cooling appear legal in all states, except CA and NJ, until EPA rules hit on Jan. 1, 2025

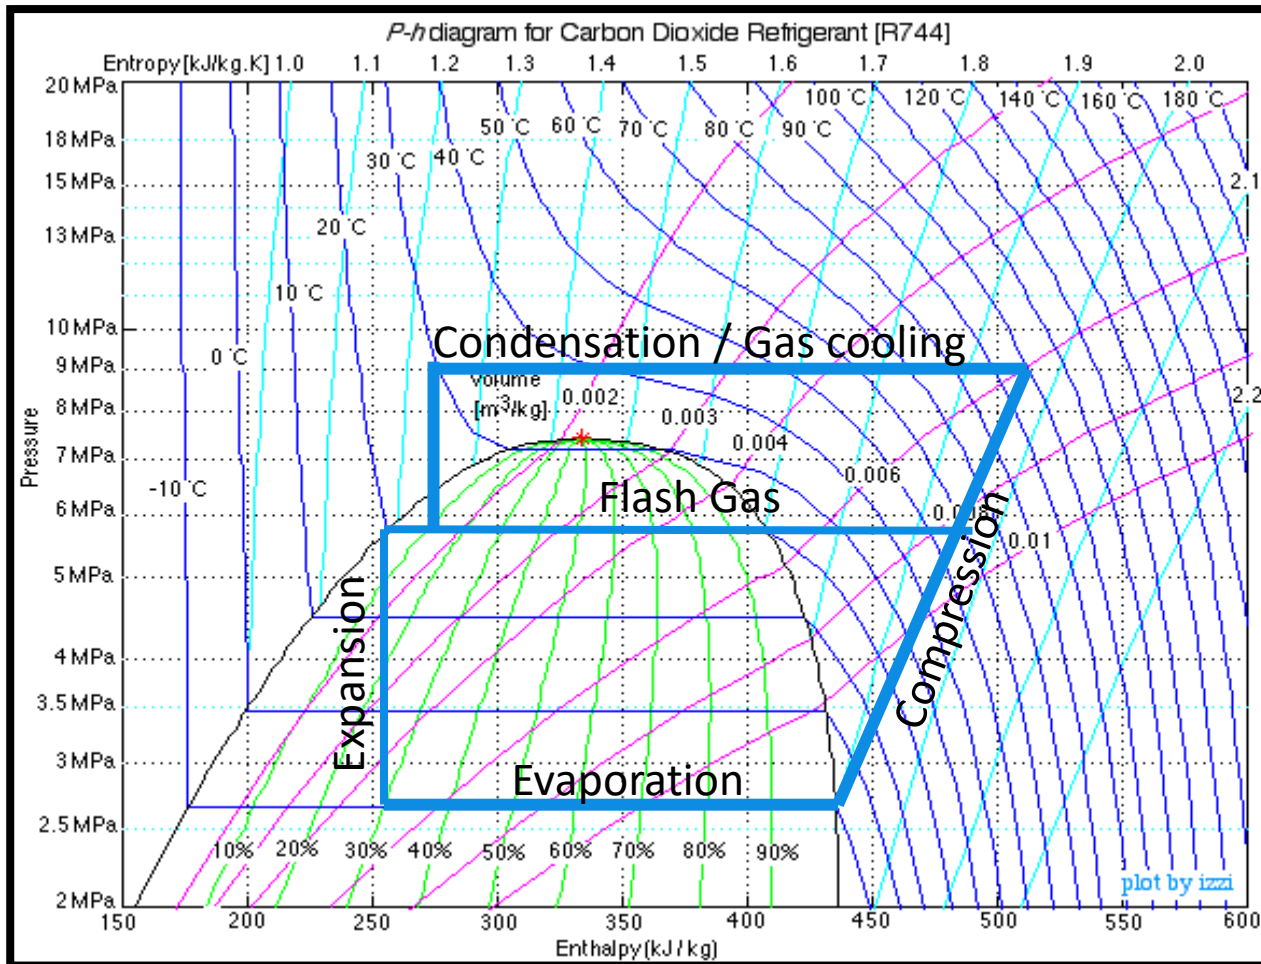

# CO<sub>2</sub> Operation: 3 Modes

1. Transcritical
2. Subcritical (Condensing)
3. Free Cooling (Economizer)

# CO<sub>2</sub>: Transcritical Compression Cycle

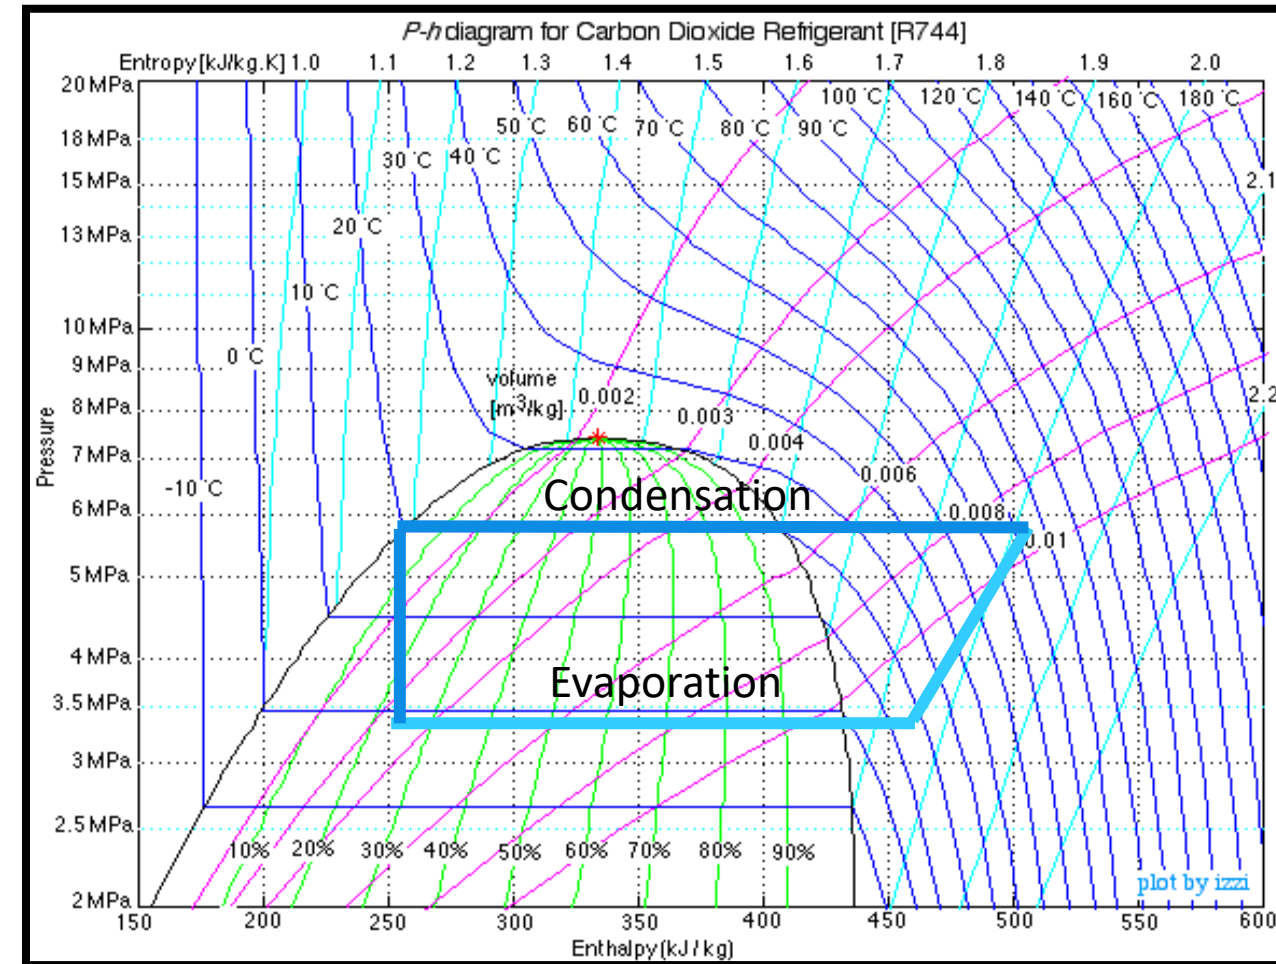

- Operation mode when the heat rejection is done at temperatures under CO<sub>2</sub>'s critical temperature
- Condenser becomes a gas cooler
- Less efficient than certain synthetic refrigerants
- Usually a small portion of the year
- *Possibility of adiabatic gas cooling to eliminate transcritical operation*

# CO<sub>2</sub>: Subcritical Compression Cycle

- Operation mode when the heat rejection is done at temperatures under CO<sub>2</sub>'s critical temperature
- 30.98C / 87.76F
- High pressure gas condenses at the condenser
- Between 55-72bar (800psi-1040psi)

# CO<sub>2</sub> FREE-COOLING (Economizer) CYCLE

## Thermosiphon (Gravity)

# Product Offerings

## TWO (2) TYPES OF STANDARD UNITS

CRAC Perimeter: 52kW, 84kW,  
105kW, 168kW capacities (275kW  
coming soon)

InRow: 40kW capacity (100kW  
coming soon)

## AQUILON CRAC with Air Cooled Gas Cooler

### Unit Description

- Operates in compression mode and free cooling mode
- Gas Cooler installed higher than the CRAC unit outside
- CRAC Unit available in upflow and downflow configuration

## Cumulus (Natural Refrigerant In-Row system) Capacity: 10TR (40 kW) → 1 unit (40 kW)

- Operational resilience
- No oil/water in the data room
- Energy savings over 70%

### 01 | Option CO<sub>2</sub> / CO<sub>2</sub>

### 02 | Option CO<sub>2</sub> / Chilled Water

units

M&M CARNOT

# Electrification: WSHP & ASHP

# CO<sub>2</sub> Transcritical Heat Pumps with Heat Recovery

- Complete and integrated solution
- **Process or HVAC chilled water loop**
  - Water, glycol, brine
  - Down to -40°F process temp.
- **Process or HVAC hot water loop**
  - Water, glycol, brine
  - Combined EER (COP) up to 55 (16)
- **Direct CO<sub>2</sub> to Domestic hot water loop**
- **Reduced foot print**
- **Full redundancy on key components**
- **Optional integrated pump skid**
- **Optional patented Rain Cycle Free-Cooling™**

## HEAT RECOVERY AVAILABLE WITH CARNOT CO<sub>2</sub> TRANSCRITICAL SYSTEMS

59 °F 15 °C	95 °F 35 °C	131 °F 55 °C	171 °F 77 °C
----------------	----------------	-----------------	-----------------

Maximum heating profile of 1000 kW  
for refrigeration load of 3,415,00 Btu/h.

Examples of heating combinations:

1. 1320 kW > 59°F / 15°C
2. 530 kW > 131°F / 55°C and 790 kW > 59°F / 15°C
3. 290 kW > 171°F / 77°C and 1030 kW > 59°F / 15°C

**DISCHARGE PRESSURE [PSIG]**  
**CONDENSING TEMPERATURE [°F / °C]**  
**DISCHARGE TEMPERATURE [°F / °C]**

*RCIntelligent is a smarter way to use the rejected energy of your process: system is composed of various components that recover energy rejected by the process in a smart and strategic way.*

# CO<sub>2</sub> TC Chillers

BEFORE

AFTER

# Installation

- **Stainless Steel Tubing per ASTM A249 TP304**
- **Orbital Welding (GTAW)**
- **No fittings: Tubes bended for direction change**

## Requirements

- Installation requirements same than for standard refrigerants
  - CSA
  - B52
  - Authority Having Jurisdiction

## R744 – SAFETY RULES

- CO<sub>2</sub> – R744 is odorless and colorless and naturally present in the air at a concentration of about 400ppm
- Long term exposure limit – 8 hours – 5,000 ppm
- Short term exposure – 15 minutes – 15,000ppm
- Makes sure room meets ventilation exhaust and detection codes
- Room should be equipped with CO<sub>2</sub> sensor to alarm at elevated CO2 concentrations.
- CO<sub>2</sub> is heavier than air, CO<sub>2</sub> sensors should be mounted as low as possible near the unit if required.

## Frequently Asked Questions

- Do you need a recirculation pump for CO<sub>2</sub> – R744?
  - ✓ Ans: No! This is due to the Thermosiphon Principle for free cooling, gravity returns refrigerant to evaporator
- Is there a maximum elevation difference between the evaporator and gas cooler?
  - ✓ Ans: No. The higher the distance, the stronger the pressure. For every 1°C = 30psi
- Are we able to perform well in high ambient regions?
  - ✓ Ans: Yes, it will perform on design days in transcritical mode. An Adiabatic Gas Cooler is available to lower the amount of transcritical hours saving energy.

## Frequently Asked Questions

- Should I be concerned about the high pressures for CO<sub>2</sub> – R744?
  - ✓ Ans: No! There are hundreds of installations for DC's and other markets (refer to case studies). The relief valve provides protection when operating in transcritical mode.
- How do the sizes of the units compare?
  - ✓ Ans: CO<sub>2</sub> has a higher heat capacity vs synthetics. Allows smaller HX, less charge for a smaller footprint
- Are components readily available?
  - ✓ Ans: Yes, CO<sub>2</sub> is standard in many industries. Lead times are running 24-30 weeks depending on quantities

## Frequently Asked Questions

- How does the installation cost for CO<sub>2</sub> – R744 compare to a traditional synthetic installation?
  - ✓ Ans: Roughly the same given a qualified technician. SS tubes are smaller and there are less joints and no traps with bended tubing.
- What is the life cycle of the equipment?
  - ✓ Ans: 25+ years, with recommended installation and maintenance, SS is high quality, robust refrigerant piping, and orbital welding and less components, all play a factor increasing lifespan.

# Case Studies

# Bell

## BELL Canada – Great for Replacement Market

- Elimination of any future phase-outs by using R-744, a natural refrigerant
- Significant decrease of Bell Canada's energy consumption related to the cooling (150,000 kwh / AQ15 unit, with an air return of 24°C / 75.2°F)
- Improvement in reliability and efficiency
- Reduction of maintenance costs (due to its simplicity)
- Positive cost-benefits ratio and overall profitability (ROI: 3 years)
- GHG reduction compared with older leaking systems
- Cooling Energy savings up to 80% (compared to older existing installations).

<https://carnotrefrigeration.com/en/case-studies/data-center-cooling>

## Hannaford - Shodack Landing, New York

- One of the world's largest refrigerated spaces (250,000ft<sup>2</sup>/23,226m<sup>2</sup>) to use a transcritical system
- CO<sub>2</sub> was safest to replace R-22
- Technicians trained at factory
- Used adiabatic GC's to save energy

### Higher Pressures just a perception:

- “It operates at a higher pressure, so right away people become nervous of those numbers,” he said. “But it’s a relative number. Your forklift carries a lot more pressure just in the hydraulic system, and nobody’s worried about that.” – Jim Baisley, Hannaford

<https://accelerate24.news/regions/north-america/hannaford-pioneers-transcritical-co2-again/2020/>

## Carnot Data Center Chiller w/ Heat Reuse

- Downtown Office Space
  - 6 Chilled water CRAH units – Total 80 Tons (280kW)
  - Replaced chillers w/ Synthetic Refrigerant
  - Natural Gas Boilers for Comfort HVAC
  - Chilled Water loop temperature 13.3/6.7C ~44/56F
  - 10L/s or 160gpm
  - Heat Recovery – 300kW
    - 42.8C to 55C Hot Water (109F-131F)
